IF YOU LIVE, WORK, OR VISIT TSUNAMI RISK ZONES

Find out if you are in a Tsunami Hazard Zone by checking the official Evacuation Plans available at www.senapred.cl.

Learn about and identify Evacuation Routes, Meeting Points and Safety Zones through SENAPRED or ask your local municipality.

WHAT TO DO IN CASE OF A TSUNAMI

If there is an earthquake and it becomes difficult to remain standing, and you are in a Tsunami Hazard Zone, evacuate immediately and move to higher ground, a designated Meeting Point or Safety Zones.

If following an earthquake, you observe that the ocean recedes to reveal seafloor evacuate immediately to higher ground, a Meeting Point or Safety Zones.

Prioritize horizontal evacuation toward a Meeting Point or Safety Zones. If this is not possible—and only as a second option—consider vertical evacuation to buildings of at least eight stories and move to the highest level possible.

If you are at sea, follow the instructions of the maritime authority. If you cannot access this information, head out to sea into deep waters.

If driving on coastal urban roads, evacuate on foot to a Meeting Point or Safety Zones, and make sure your vehicle is not blocking evacuation routes. If driving in rural areas, reduce your speed and move away from the coastline toward higher ground.

Stay away from river mouths. Do not cross streams or rivers, as a tsunami can advance several kilometers inland, flooding coastal areas.

Stay informed through official alert and warning channels. If authorities issue a tsunami evacuation order, proceed to a designated Meeting Point or Safety Zones. You can check current alerts at www.senapred.cl.

Return to your home only when instructed to do so by the authorities.

GENERAL CONSIDERATIONS

- Find out if the area where you live or are visiting is exposed to any specific hazards and get informed about the emergency plan established by the local municipality.
- Emergencies do not only affect people, animals and pets are also impacted. Make sure to include them in your preparedness plans.
- Prepare and put into practice your “Prepared Family Plan” by visiting www.senapred.cl, where you can also learn how to assemble your Emergency Kit.
- Disasters, whether natural or human-induced, do not affect everyone equally. Their impacts vary across different groups, including women, men, children, older adults, persons with disabilities, and ethnic communities. Their specific needs and capacities must be considered in preparedness and response plans.

What is a tsunami?

A tsunami is a physical phenomenon caused by earthquakes that affect the ocean floor; however, they can also be triggered by landslides, underwater collapses or volcanic eruptions, and other events that displace the water column. A tsunami emerges as a large mass on the coast, which can flood and destroy coastal areas, depending on their level of preparedness.

Tsunamis triggered by earthquakes near the coast may reach land within minutes, and their effects can last for several hours after the earthquake. In Chile, regional or transoceanic tsunamis can also occur, coming from hundreds or even thousands of kilometers away, and taking hours to reach our shores.

¹ Tsunami Hazard Zone: A designated zone that must be evacuated due to an imminent or ongoing event, such as a tsunami.

² Meeting Point: A designated gathering place located outside the Hazard Zone, where evacuees assemble to ensure their safety.

³ Safety Zone: A location with the lowest possible risk in relation to the hazard, located outside the Tsunami Evacuation Area. It may not be physically marked or delimited.

RECOMMENDATIONS “TSUNAMI” – TSUNAMI RISK ASSESSMENT BUREAU:

- Ministry of Public Works
- Ministry of Housing and Urban Planning
- Superintendency of Health Services (SISS)
- Hydrographic and Oceanographic Service of the Chilean Navy (SHOA)
- National Seismological Center (CSN)
- Department of Civil Engineering, Federico Santa María Technical University
- National Service for Disaster Prevention and Response (SENAPRED)
