Landslides

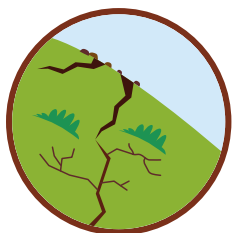

SENAPRED
Ministerio del
Interior

Gobierno de Chile

IF YOU LIVE, WORK, OR VISIT AREAS PRONE TO LANDSLIDES:

Identify the slopes nearest to your home and check whether landslides or collapses have occurred there in the past.

If possible, inspect the slope and surrounding area for cracks or leaning vegetation. Report any such signs to the Municipality so that necessary measures can be taken in coordination with technical agencies.

Avoid cutting down trees or disturbing vegetation on the slopes.

If you plan to build near a slope, choose a suitable location, considering distance and potential interventions. If mitigation measures are required, seek advice from specialists.

WHAT TO DO IN CASE OF A LANDSLIDE:

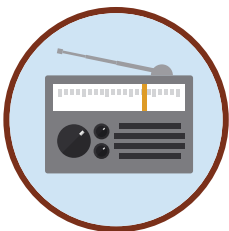

If you are in a risk area and observe a landslide, stay calm, seek shelter, and notify your community, if possible.

If evacuation is necessary, take your pre-prepared emergency kit. Do not attempt to rescue or retrieve material belongings.

Contact first-response organizations: Firefighters (132), Police (133), and local authorities.

Follow official updates from authorities closely.

Do not endanger yourself or others by recording the event or engaging in dangerous actions.

AFTER A LANDSLIDE

Stay away from affected areas. Do not approach the landslide zone, as they may remain unstable with risks of further movement.

Do not walk on the landslide deposits or debris.

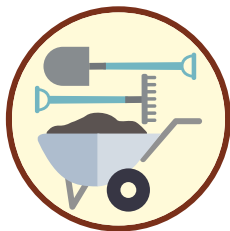

Return only when local authorities indicate it is safe to do so.

to learn how to prepare your **Emergency Kit**.
Don't forget your pets! 

AFTER A LANDSLIDE

Assist with rehabilitation tasks as directed by local authorities.

Do not build on sliding material or debris.

GENERAL CONSIDERATIONS

- Find out if the area where you live or are visiting is exposed to any specific hazards and get informed about the emergency plan established by the local municipality.
- Emergencies do not only affect people, animals and pets are also impacted. Make sure to include them in your preparedness plans.
- Prepare and put into practice your **“Prepared Family Plan”** by visiting www.senapred.cl, where you can also learn how to assemble your **Emergency Kit**.
- Disasters, whether natural or human-induced, do not affect everyone equally. Their impacts vary across different groups, including women, men, children, older adults, persons with disabilities, and ethnic communities. Their specific needs and capacities must be considered in preparedness and response plans.

What is a Landslide?

A landslide is the downward displacement of soil or rock, mainly happening on a slope, resulting in significant deformation of the terrain. The area of greatest impact and risk is typically located at the base of the slope.
